THE TECHNOLOGY BEHIND THE TRANSACTION

## MagTek Develops Encrypting IntelliHead for PCI 2.0 Compliance

MagTek will introduce the Encrypting IntelliHead at ETA's 2007 Annual Meeting and Expo. The Encrypting IntelliHead is a magnetic read head with encapsulated electronics to read, decode, and encrypt card data directly inside the head.

The Encrypting IntelliHead incorporates MagTek's state-of-the-art Delta ASIC, proven technology used widely to read 3-track data in many financial and retail card reading applications. All electronics are securely potted inside the head to prevent tampering and unauthorized access.

Also available from MagTek: MagneSafe™ readers, a family of secure card readers that provide important security features such as 3DES encryption, secure token-based multifactor authentication and website authentication.

**Additionally, MagTek will be featuring the following products:**

### Excella STX

A compact dual-sided check scanner ideal for electronic check applications, including BOC, Check 21 and Remote Deposit Capture.

Excella STX includes an optional 3-track MSR and an innovative feature that allows for single-side scanning of standard ID cards.

### ExpressCard 1000

The industry's first all-in-one desktop platform to instantly issue and personalize cards at the branch or retail location.

**For more information on the latest card reading and checking scanning technology, visit MagTek at booth #709, or contact John Arato at 800-421-5208 x6611, or go to [www.magtek.com](http://www.magtek.com)**
